

Hosted Employee Telephone Punching. Pay for what you use, we'll do the rest.

Overview

US TelePunch is a hosted Interactive Voice Response system designed to securely collect, transmit and place your employee's punches directly into electronic time cards.

US TelePunch provides a reliable method for organizations either preferring to have employees punching via the telephone, or find it economically unfeasible to use traditional electronic time terminals.

US TelePunch allows companies to leverage a stable, hosted service and pay only for the services they use, rather than incurring a capital expenditure in equipment requiring installation, maintenance, support, backups and upgrades.

US TelePunch is a safe and secure system that helps companies reliably account for an employee population of any size, whether they are all in one building or distributed throughout the world.

US TelePunch integrates directly with your Employee Attendance System eliminating the need for manually executed import processes, text files and time delays. Your system is kept current up to the minute.

US TelePunch also provides an incoming call monitoring process that performs complete transaction logging in order to keep administrators informed for auditing and reporting.

USTP iControl panel provides a secure method for authorized users to access their punch collection task properties.

US TelePunch Features

Strong Encryption. USTP employs industry standard encryption technology along with streaming data compression to safely transfer your data in the minimum time requirement.

Event-Driven Transfers. USTP monitors incoming calls and recently created punch transactions and acts upon those results automatically by transferring your punches directly and immediately to their intended destination.

Security and Data Integrity is managed in several ways. Caller ID (when available) is captured, company codes and employee ID#'s are required prior to accepting or validating any punch transaction.

Transactional Data and Records are maintained in the event your attendance system crashes and transaction records need to be re-built or data is required for auditing purposes.

Scheduled or Manual retrieval of your employee's punches, it's your choice. USTP operates 24-7 and client-administrators may choose to have punches downloaded and integrated on a pre-schedule basis or on demand whenever you choose.

How it works!

When employees call in to US TelePunch to create a punch, they are greeted with a friendly voice requesting two pieces of information – their Company Code, and their Employee ID#.

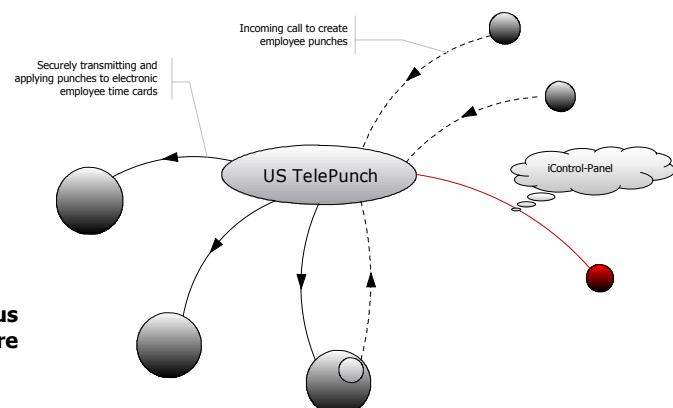

Once that information is captured, employees hear a verbal confirmation indicating the time and date of their punch and the system hangs up.

During the employee phone call, the system logs the Caller ID, Co. Code, Employee ID, Time & Date, and the duration of the call. US TelePunch logs that information for your administrative and reporting needs and is available to you on demand.

Once employees have punched, US TelePunch waits for the client's USTP Agent (a small installed software program) to request punches. Once the schedule or manual request is made, an encrypted secure connection is created to the host, the punch data is compressed in-stream and deposited directly into your employee attendance system time cards.

Full transaction records and receipts are available to our clients on our secure website.

Why pay for expensive systems that you have to install, host, manage, maintain and upgrade? USTP is simple. Pay for what you use, we'll do the rest!
